

# UltraVnc SC (SingleClick)

ULTRA VNC POWER

## How to setup and configure a custom Ultr@VNC SC EXE with your router's settings STEP by STEP.

By Donald Muir (Dwalf) 16 October 2005  
This document is use at your own risk.

### About:

[Ultr@VNC](#) SC (*Short for Single Click*) is a remote support tool. With [Ultr@VNC](#) SC you need only setup a **helpdesk.txt** and your local **router** (*There is no need to setup anything on the clients computer you intend to control*), and in a few steps you will be able to offer remote support to your clients. Many people today are opting to use [Ultr@VNC](#) for its powerful and useful place in the IT Support market. [Ultr@VNC](#) is protected by the **GPL** (*General Public License*). [Ultr@VNC](#) is also supported by enthusiastic Internet community, meaning that no other company can match the ideas or influence and speed of development of [Ultr@VNC](#), using cutting edge technology [Ultr@VNC](#) will be showing the in years to come.

### Index:

- Download [Ultr@VNC](#) SC custom.zip.
- Unpack the ZIP file into a folder.
- Setting up your router to support [Ultr@VNC](#) SC.
- Configure the helpdesk.txt.
- Editing your company logo for EXE
- Editing your Icons with IconoMaker.
- Repack the files into a ZIP file.
- Compiling your ZIP file to a EXE file on-line.

## Section 1:

# Download [Ultr@VNC](http://sc.ultravnc.com) SC custom.zip builds

Before you can start building your own [Ultr@VNC](http://sc.ultravnc.com) SC support tools you will need to download the custom.zip build from UltraVNC web site.

1. Open Internet Explorer and in the address bar type in the **FULL URL** as indicated below.  
<http://sc.ultravnc.com>

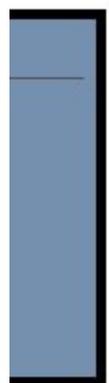

2. On the bottom of this web page you will see a links. Click on the link [How do you create your own version](#) as indicated below.

- The SC version is initiated by the person that shares his d connection.
- You can use up to 128bit encryption. The encryption level
- The server can only connect to the IP adress you have pr
- No incoming connections, no unattended service connectic
- SC is automatically and systematically uninstalled when t

[How do you create your own version ?](#)

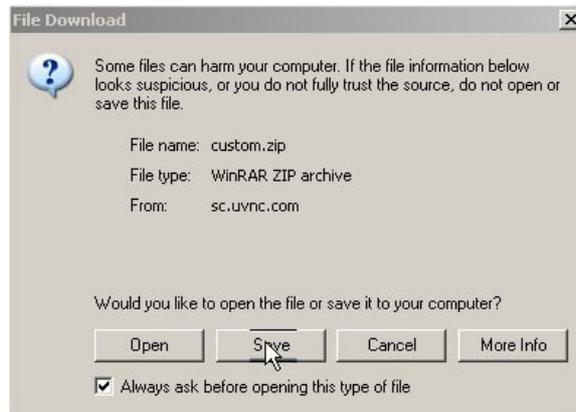

3. On the new web page you towards the top of the page you will see a link called [custom.zip](#). Click on the [custom.zip](#) link as indicated below.

### How to create my own version?

- 1) Download [custom.zip](#)
- 2) Replace the icons ,bmp and ro4.key file with you  
++Bmp need to be a windows bitmap, **max color**  
icons, standard window icons: only 32x32 standar  
**The bigger the icons and bmp are, the bigge**  
file  
SAME NAMES MUST BE USED.....logo.bmp icon1.ic
- 3) replace the ro4.key with your own version or re  
To create your own key you need the normal Ultra

4. After you had clicked on the [custom.zip](#) link you will be prompted to download. Click on the **SAVE** button.

5. After clicking on **SAVE** you will be prompted to select a download location, ensure you folder path is your desktop and click on **SAVE** to save the [config.zip](#) to your desktop.

6. After downloading the file to your desktop you may be prompted to **OPEN** or **CLOSE** the download. For now we will just **CLOSE** the download.

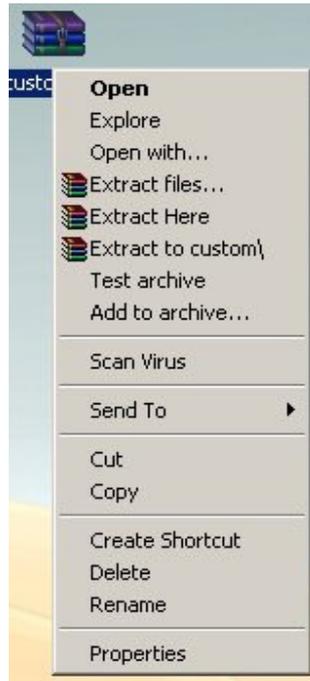

7. **Congratulation's** you have successfully downloaded the [ULTR@VNC SC custom.zip](#).

## Section 2:

# Unpack the ZIP file in to a made folder using 7-ZIP

1. Before you start unpacking the compressed archive file(*archive file = file with files inside*) you may need a program to do this with. There are many around on the market. Example 7-ZIP, WINRAR, WINZIP and Windows XP also has this function. For this illustration we will use **WINRAR**. You can download winrar from <http://www.rarlab.com/download.htm>
2. On the desktop right click on custom.zip (*mouse point must be on the file*) on your desktop and click on **Extract to custom\**.

3. After extracting the files you will see a new folder on your desktop called **CUSTOM**.

4. Double left click to open this folder and after opening this folder you will see the following files.

5. **Congratulation's** you have successfully unpacked the files in a folder.

## Section 3:

# Configure your Broadband Internet router to do Port Forwarding.

1. You only need setting up your router, there is no need to setup a clients router as [Ultr@VNC SC](#) does a look back connection out of their system.

By default most routers are the gateway on your network and are mostly accessible via a **HTTP** (a web page) to find your router you may need to ask your administrator or do the following. Click on Windows **START** button and click on **RUN**.

In the run bar type **CMD** as indicated below.

You now will see the **COMMAND PROMPT** window, in the window type **IPCONFIG** and press the **ENTER** key on the keyboard when done. As you can see as indicated below the **DEFAULT GATEWAY** on this computer is **192.168.123.254**

```
C:\WINDOWS\System32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Documents and Settings\User>IPCONFIG

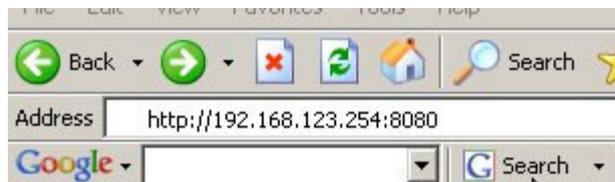

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : 
    IP Address . . . . . : 192.168.123.125
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.123.254

C:\Documents and Settings\User>
```

We now can enter the gateway into Internet Explorer's Address bar but still will need to find out what the port is (*In most cases you need not put any port number at the end, just enter the GATEWAY ADDRESS*), If you don't know you could run a port scanner to find where another **HTTP** server is running on your subnet. Or ask the person who had setup your router or read the documentation of the router or perhaps the router came with software. On this router **PORT 8080** was used so i will be entering <http://192.168.123.254:8080> into Internet Explorer's Address Bar as indicated below.

2. After connecting to your router via a web page you will need to enter a Username and Password. If your router has no Username and Password or still is using the default Username and Password i suggest you change it to something secure before you find your self hacked out of your router. When changing your password ensure you don't lock yourself out with mistakes, Most routers have a reset button what will reset to defaults but it does mean you will loose all your information and configuration on the router.

3. After you have connected to your router you will need to forward some **PORTS** to different computers on your LAN. What we are doing here is we are telling the router to watch for connection on certain ports on the Internet side (*Ports are like Internet doors to your network*) and when it gets a connection from the Internet side (*Connection comes from CLIENT Ultr@VNC SC program*) it must send the connected **PORT** to a particular computer and PORT on your local network.

**Example:**

**CLIENT SC (Helpdesk.txt directed) -> ROUTER WANIP:PORT (Port Forward)-> LANIP:PORT**

4. Here is a example **DRAYTECH VIGOR 2600** Setup. You need to find the port forwarding setting on this router it uses **NAT** to **forward ports**. On the router setup page click on **NAT Setup** as indicated below.

The screenshot shows the 'Setup Main Menu' of a DrayTek Router Web Configurator. The page is titled 'DrayTek Router Web Configurator' and includes a 'Setup Main Menu' section with 'DrayTek Corp.' branding. On the right, system information is displayed: Model: Vigor2600 plus series annex A, Firmware Version: 2.5.6\_UK, Build Date/Time: Mon Feb 21 17:14:4.5 2005, and LAN MAC Address: 00-50-7F-2E-92-FA. The main menu is divided into four sections: 'Basic Setup (Setup First)' with links for Administrator Password Setup, LAN TCP/IP and DHCP Setup, and Wireless LAN Setup; 'Quick Setup' with a link for Internet Access Setup; 'Advanced Setup' with links for Dynamic DNS Setup, Call Schedule Setup, NAT Setup, RADIUS Setup, Static Route Setup, IP Filter/Firewall Setup, VPN and Remote Access Setup, UPNP Service Setup, VLAN/Rate Control, and QoS Control Setup; and 'System Management' with links for Online Status, VPN Connection Management, Configuration Backup / Restoration, SysLog / Mail Alert Setup, Time Setup, Management Setup, Diagnostic Tools, Reboot System, and Firmware Upgrade (TFTP Server). A copyright notice at the bottom reads 'Copyright (c) 2004, DrayTek Corp. All Rights Reserved.'

On the next page click on **Configure Port Redirection Table**.

The screenshot shows the 'NAT Setup' page within the DrayTek Router Web Configurator. The breadcrumb trail at the top indicates the path: '> Advanced Setup > NAT Setup'. A '<< Main Menu' link is visible in the top right corner. The main content area contains four menu items: '>> Configure Port Redirection Table', '>> DMZ Host Setup', '>> Open Ports Setup', and '>> View Well-Known Ports List'. Below these items, a table lists private IP address ranges defined by RFC-1918:

Private IP Address Range defined by RFC-1918:			
10.0.0.0	---	10.255.255.255	(10/8 prefix)
172.16.0.0	---	172.31.255.255	(172.16/12 prefix)
192.168.0.0	---	192.168.255.255	(192.168/16 prefix)

A copyright notice at the bottom reads 'Copyright (c) 2004, DrayTek Corp. All Rights Reserved.'

You now will need to change the settings of the **NAT PORT REDIRECTION TABLE** window.

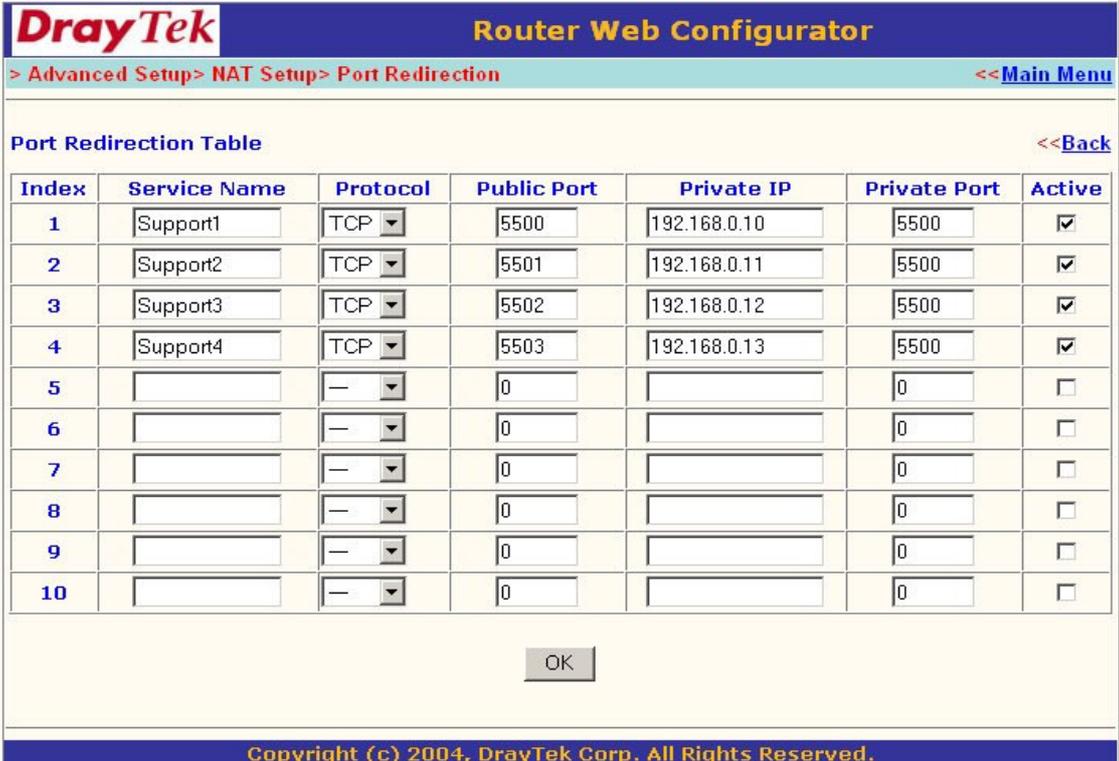

Under **Service Name** enter **anything** you want.

Under **Protocol** select **TCP**

Under **Public Port** (*This is the Internet side Port*) Enter the ports you'll use later in helpdesk.txt

Under **Private IP** Enter the **IP Address** of the computer give support to the client (This is the computer running **VNCVIEWER – Listen** on your network)

Under **Private Port** enter the port number (5500 is vncviewer's default port number) of the support computer running **VNCVIEWER – Listen** on your network.

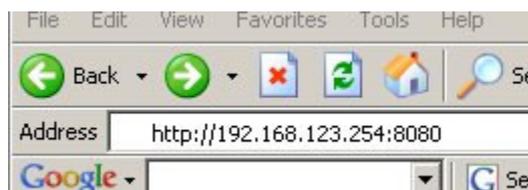

The screenshot shows the DrayTek Router Web Configurator interface. The title bar reads "DrayTek Router Web Configurator". The breadcrumb navigation is "> Advanced Setup> NAT Setup> Port Redirection" with a "<<Main Menu" link. The main content area is titled "Port Redirection Table" with a "<<Back" link. It contains a table with 7 columns: Index, Service Name, Protocol, Public Port, Private IP, Private Port, and Active. The table has 10 rows. The first four rows are pre-filled with service names "Support1" through "Support4", protocols set to "TCP", public ports 5500-5503, private IPs 192.168.0.10-192.168.0.13, and private ports all set to 5500. The "Active" column has checkboxes checked for the first four rows. Rows 5-10 are empty, with protocols set to a dash, public ports set to 0, private IPs and ports empty, and "Active" checkboxes unchecked. An "OK" button is located below the table. The footer contains the text "Copyright (c) 2004, DrayTek Corp. All Rights Reserved."

Index	Service Name	Protocol	Public Port	Private IP	Private Port	Active
1	Support1	TCP	5500	192.168.0.10	5500	<input checked="" type="checkbox"/>
2	Support2	TCP	5501	192.168.0.11	5500	<input checked="" type="checkbox"/>
3	Support3	TCP	5502	192.168.0.12	5500	<input checked="" type="checkbox"/>
4	Support4	TCP	5503	192.168.0.13	5500	<input checked="" type="checkbox"/>
5		—	0		0	<input type="checkbox"/>
6		—	0		0	<input type="checkbox"/>
7		—	0		0	<input type="checkbox"/>
8		—	0		0	<input type="checkbox"/>
9		—	0		0	<input type="checkbox"/>
10		—	0		0	<input type="checkbox"/>

Now lets look at a different router and its setup. For this Example we will use a **SAFECOM Multi-Functional Wireless ADSL Router**.

Same as before we connect to the router via **Internet Explorer** and enter the **Default Gateway** as indicated below.

We now will need to enter a **password** only as this kind of router does not require a Username  
Enter your password and login to the router as indicated below.

Item	WAN Status	Sidenote
WAN Type	PPP over ATM	
IP Address		
Subnet Mask	255.255.255.255	
Gateway		
Domain Name Server		
ADSL Connection (DownStream/UpStream)	576 Kbps/288 Kbps	Fast Mode
Connection Time	110:28:15	

Item	Peripheral Status	Sidenote
Printer	Not ready	

Statistics of WAN	Inbound	Outbound
Octets	2050251102	545456
Unicast Packets	8588880	68132
Non-unicast Packets	0	0

On this router you now will need to click on the **Forwarding rules** as indicated below and then click on the **Virtual Server** link.

- [Status](#)
- [Wizard](#)
- [Quick ISP Setting](#)
- + [Basic Setting](#)
- [Forwarding Rules](#)
  - [Virtual Server](#)
  - [Special AP](#)
  - [Miscellaneous](#)
- + [Security Setting](#)
- + [Advanced Setting](#)
- + [Toolbox](#)

[Log out](#)

On the Virtual Server link you will be able to do your port forwarding. As you can see with this type of router you wont be able to select the local LANIP port and will only be able to **PORT** the entire **PORT** to the same port on the LANIP computer. This is not a problem because vncviewer.exe can listen on different ports (*default is 5500 unless changes in command line*) on the support computer. So on the support computer you would run vncviewer with the following parameters. **VNCVIEWER.EXE -LISTEN PORT**

**Example: vncviewer.exe -listen 5502**

To setup port forwarding on this router enter as indicated below.

Under **Service Port** enter the port the router should forward from the Internet side.

Under **Server IP** enter the computer on the **LAN** where the **PORT** should be sent to.

Under **Protocol Type** enter **BOTH** or **TCP**

**Remember to Enable the forwarded ports under Enable.**

Virtual Server						
ID	Service Ports	Server IP	Protocol Type	Enable	Use Rule#	
1	5500	192.168.123.10	BOTH	<input checked="" type="checkbox"/>	0	
2	5501	192.168.123.11	BOTH	<input checked="" type="checkbox"/>	0	
3	5502	192.168.123.12	BOTH	<input checked="" type="checkbox"/>	0	
4	5503	192.168.123.13	BOTH	<input checked="" type="checkbox"/>	0	
5		192.168.123.	BOTH	<input type="checkbox"/>	0	

There are many different router with different setups, most of them basically use the same technology in port forwarding. Below is a links from [Ultr@VNC](http://doc.uvnc.com/addons/routerconf.html) website for you to with more router setups to look at.

<http://doc.uvnc.com/addons/routerconf.html>

In some cases with older routers you cannot do Full NAT and you may want to look then at getting a router what has a lot more functions, You can get really cheap good working routers from.

<http://www.ebuyer.com> or <http://www.ebuyer.co.uk>

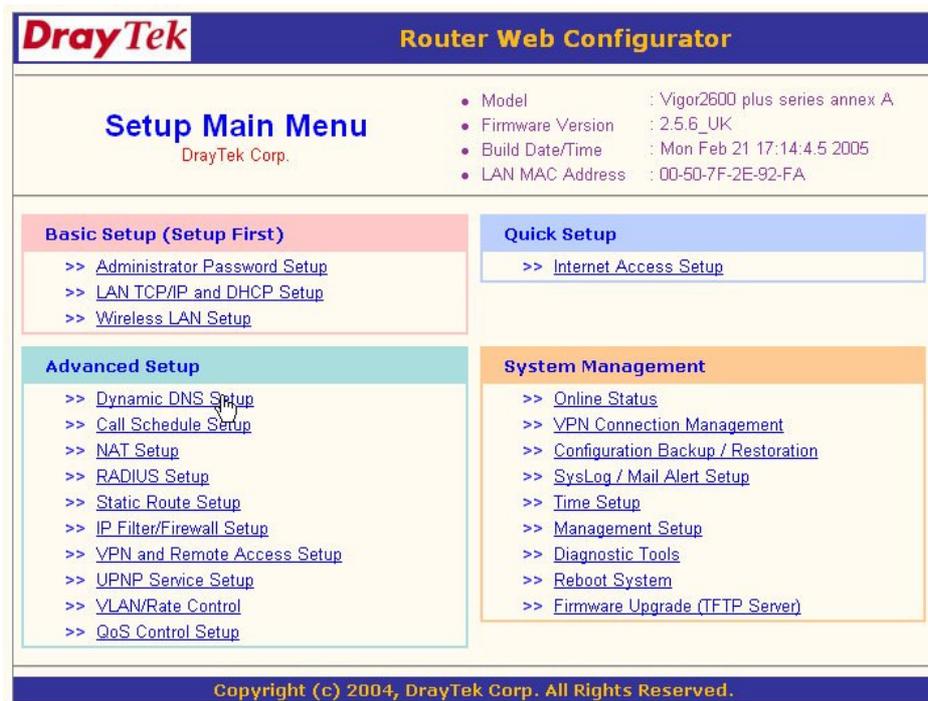

Note you get two different kind of Broadband routers, one is a ADSL router with built in modem and the other is a Cable router, this is a router with no modem and has a RJ45 connection to connect to to your Internet with.

5. With [Ultr@VNC SC](#) using your Internet IP Address is not always a good idea. Many people do not have a static intranet IP Address and use a Dynamic Internet IP Address. (Dynamic IP is a IP what changes allot) If you do have a Static IP you could associate a Domain name to it, but in any case many people opt to use a Dynamic DNS name because there are so many company's whom offer these services for free.

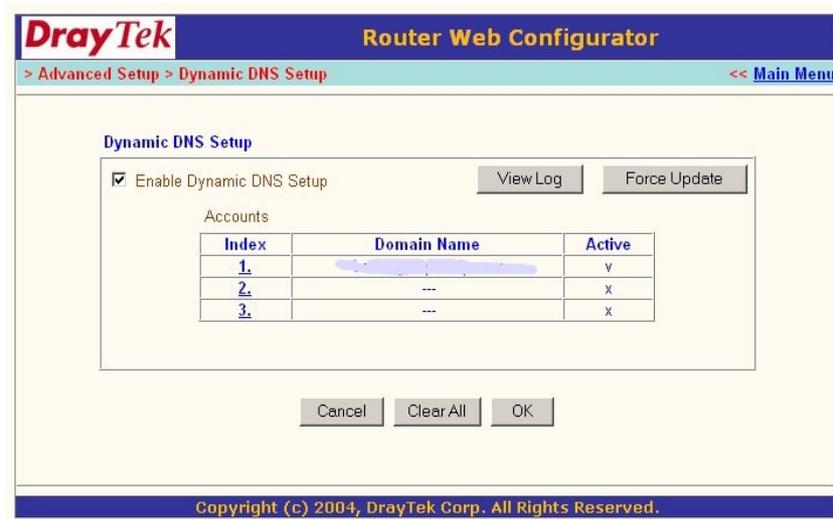

Most routers today can automatically update Dynamic DNS service providers. Two Big Players in this field is <http://www.no-ip.com> and <http://www.dyndns.com>

After you had registered (*use the free version*) to one of these two provider you normally will be given a certain number of certain domains names for free. Choose a domain name with a supplied extension and keep the name professional. The Dynamic DNS service providers will delete you domain if its not been used for a certain time period.

Lets look at the Draytek Routers **Dynamic DNS Setup**. On the Draytek main menu click on the **Dynamic DNS setup** link to continue.

On the **Dynamic DNS Setup** menu click on **Enable Dynamic DNS Setup** to enable this function and then click on **Index 1** to setup the Dynamic DNS account you have from **NO-IP** or **DYNDNS**. If you have more than one you can enter more in the other Index sections.

On Account Index 1 you will again need to click on Enable Dynamic DNS Account. Under Provider select the Dynamic DNS provider you are using.

Under **Domain Name** enter the domain name you chose and then the extension in the drop down.

Under **Login Name** enter the username the Dynamic DNS provider gave you (*normally email*)

Under **Password** enter the password the Dynamic DNS provider has give or you have chosen.

**DrayTek Router Web Configurator**

> Advanced Setup > Dynamic DNS Setup > Dynamic DNS Account Setup << Main Menu

Index : 1

Enable Dynamic DNS Account

Service Provider: NO-IP.COM Free (www.no-ip.com)

Service Type: Dynamic

Domain Name: [Redacted] . no-ip.com

Login Name: [Redacted] (max. 23 characters)

Password: [Redacted] (max. 23 characters)

Wildcards

Backup MX

Mail Extender : [Empty Field]

Cancel Clear All OK

Copyright (c) 2004, DrayTek Corp. All Rights Reserved.

In some cases your router may not have a Dynamic DNS updater function, Both **DynDNS** and **NO-IP** have software you can install on your computer to update the domain to your Internet IP. (Very useful for dial up modems)

**You can download them here.**

**DynDNS**

<http://www.dyndns.com/support/clients/>

**NO-IP**

<http://www.no-ip.com/downloads.php>

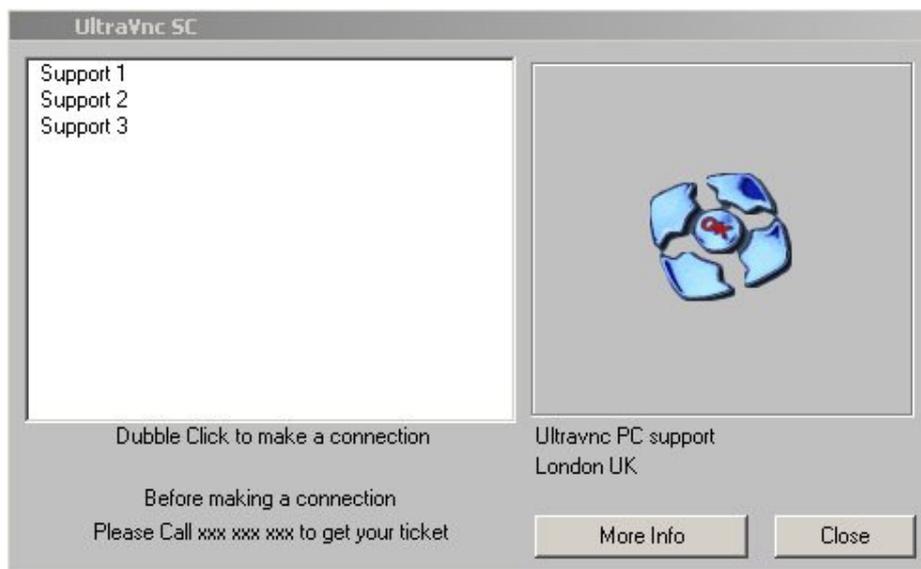

6. **Congratulation's** you have hopefully successfully understand port forwarding and have setup your own router.

## Section 4:

# Configure the helpdesk.txt

1. You now will need to configure the helpdesk.txt. The helpdesk.txt tells winvnc where to connect to. Since this configuration is meant to run on the clients computer, the client computer (The Computer you wish to control via remote connection) will need to know how to find your vncviewer.exe running in -listen mode. To do this we need to tell the helpdesk.txt what Internet WAN IP to connect to and at what ports it will need to connect to (*This is why we needed to do PORT Forwarding on your router*).

After the client has run the EXE they will see something similar to below. There is Two main ways of setting up the helpdesk.txt. One way as seen below where the client see multiple support people and double clicks on the support person they wish or was asked to serve them another way would be to create a EXE for each support person and use the **[DIRECT]** option, this will connect directly to the support person with out the clients intervention.

Lets look at setting the helpdesk.txt to support multiple support people in one **EXE**.  
Open the **HELPDESK.TXT** in the **CUSTOM** folder on your desktop with notepad.

### OPTION1:

[TITLE] -- You can change this section, it is displayed at the top of the EXE window  
UltraVnc SC

[HOST] -- This is the First Support person Section  
Support Person 1 -- This is the Name of the First Support Person, you can change this to  
-connect 192.168.0.10:5500 -noregistry --This is the Router IP and PORT you forwarded to the First Support Persons Computer on the router.

[HOST] -- This is the Second Support person Section  
Support Person 2 -- This is the Name of the Second Support Person, you can change this too  
-connect 192.168.0.11:5500 -noregistry --This is the Router IP and PORT you forwarded to the Second Support Persons Computer on the router.

[HOST] -- This is the Third Support person Section  
Support Person 3 -- This is the Name of the Third Support Person, you can change this too  
-connect 192.168.0.12:5500 -noregistry --This is the Router IP and PORT you forwarded to the  
Third Support Persons Computer on the router.  
You can continue to add more Support people if you want  
or less if you want

[TEXTTOP] -- You can change allot of the TEXT to reflect your company info.  
Dubble Click to make a connection

[TEXTMIDDLE]  
Before making a connection

When your done **SAVE** your edited file.

3. **Congratulation's** you have successfully finished the helpdesk.txt

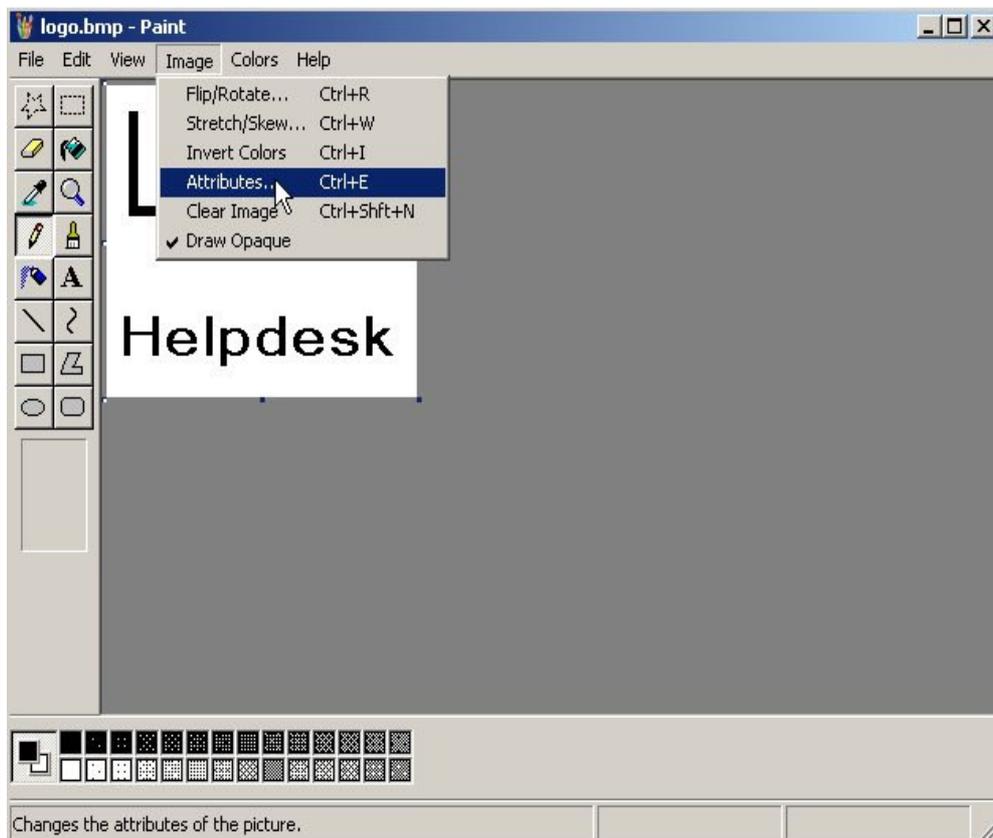

## Section 5:

# Editing your company logo for the EXE

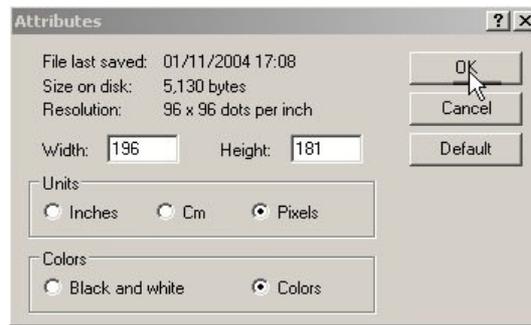

1. You can customize your EXE by editing the FILE logo.bmp and placing your company on the logo.bmp file. Put your logo on your EXE, open the **CUSTOM** folder and right click on the **logo.bmp**

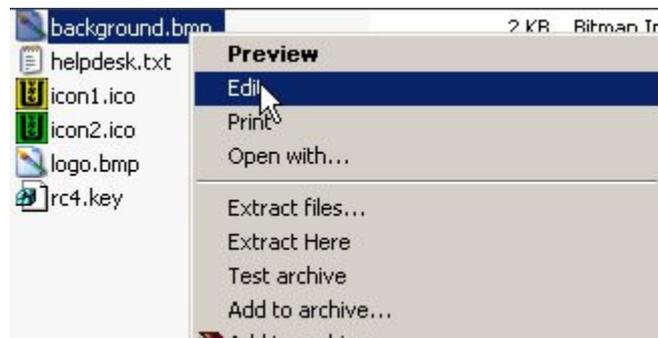

2. By default Windows Paint will open, but you can use other editors as well to change the SC. Once the logo BMP file is open you can edit the image. By default the image is **black and white** to reduce the size of the EXE but you can add color by clicking on the **IMAGE** tab and selecting **ATTRIBUTES**. You can also add your own image as long as its the same size as the logo.bmp

3. On the **ATTRIBUTES** windows click on **COLOR** and then click **OK**.

4. When your done editing your logo.bmp **SAVE** your file.
5. You can also change the background of the EXE by editing the file **background.bmp** in the **CUSTOM** folder by following the same instructions as above.

6. You also can get some free different colored samples on [ULTR@VNC](http://sc.uvnc.com/index.php?section=13) website click on the link belows and save the files **SAMPLE** as shown below in your **CUSTOM** folder, delete the old background.bmp and rename the new **BMP** file you downloaded to background.bmp

<http://sc.uvnc.com/index.php?section=13>

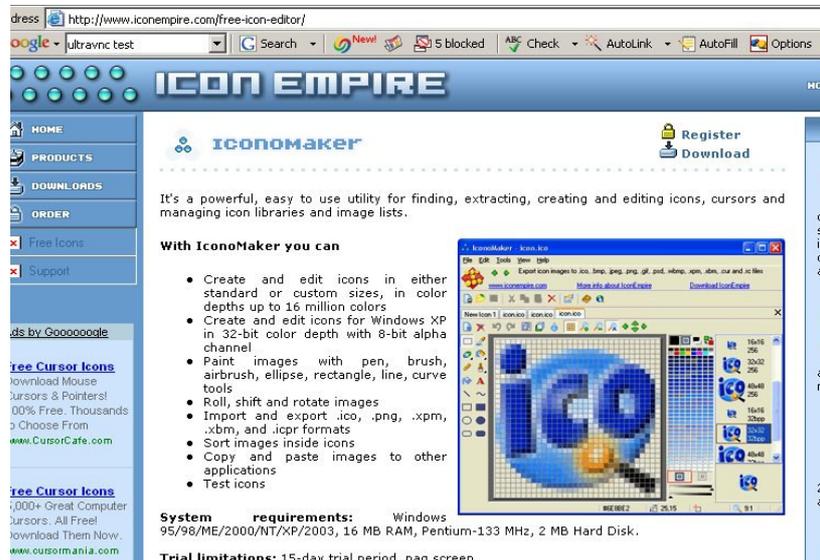

5)Color background:  
You can add a color background by adding a file background.bmp to the zip file  
Size 1x283, this bmp is stretch as background  
[Sample](#) , [Sample](#) , [Sample](#) , [Sample](#)  
6) Create a zip File from the files you want to customize  
minimum: helpdesk.txt  
maximum helpdesk.txt rc4.key icon1.ico icon2.ico logo.bmp background.bmp

7. **Congratulation's** you have successfully finished the editing your logo and background BMP

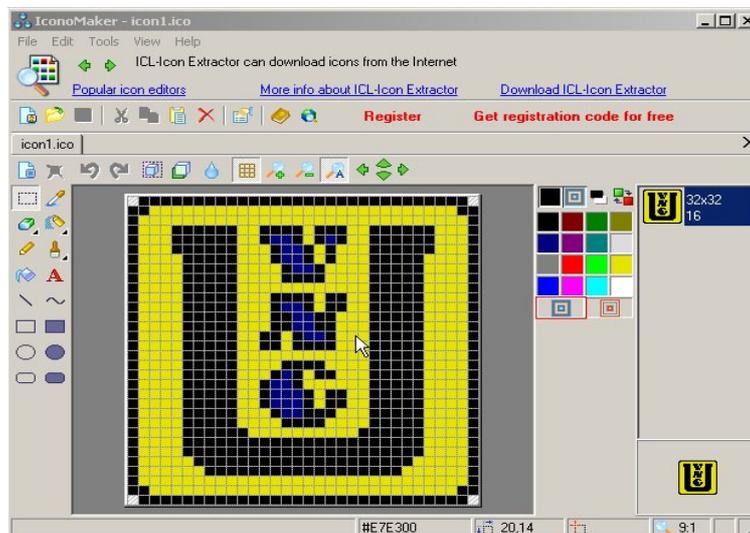

## Section 6:

# Editing your Icons with IconoMaker

1. You can edit the icons to reflect your company logos too. You will need a icon editor to edit the icons and save them you can get a free icon editor at <http://www.iconempire.com/free-icon-editor>

2. There are two icon files you can edit.  
**Icon1.ico** is the icon file the client will see running in the Windows task bar.  
**Icon2.ico** is the icon associated to the EXE file you client download from you.
3. After you installed Iconomaker you can start using it Open and close iconomaker and insure you **associated** it to open .ico files when it asks you when you open it for the first time.
4. You now can edit the icon files by opening the **CUSTOM** folder and right click on a **.ico** file and select **OPEN WITH** and then select **ICONOMAKER**. (You only need do this once and then **EDIT** only after that) When done remember to **SAVE** your files.

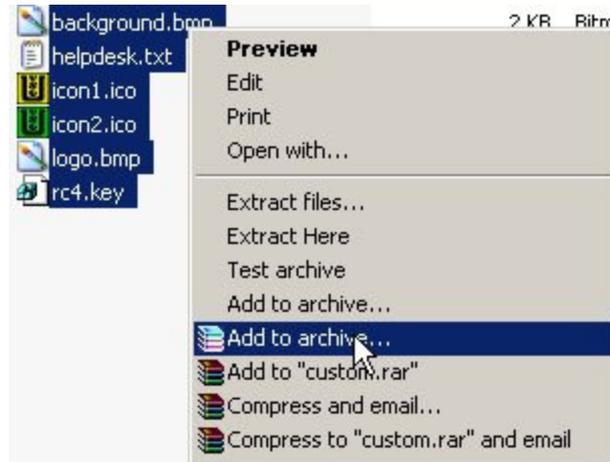

5. **Congratulation's** you have successfully Edited your icons.

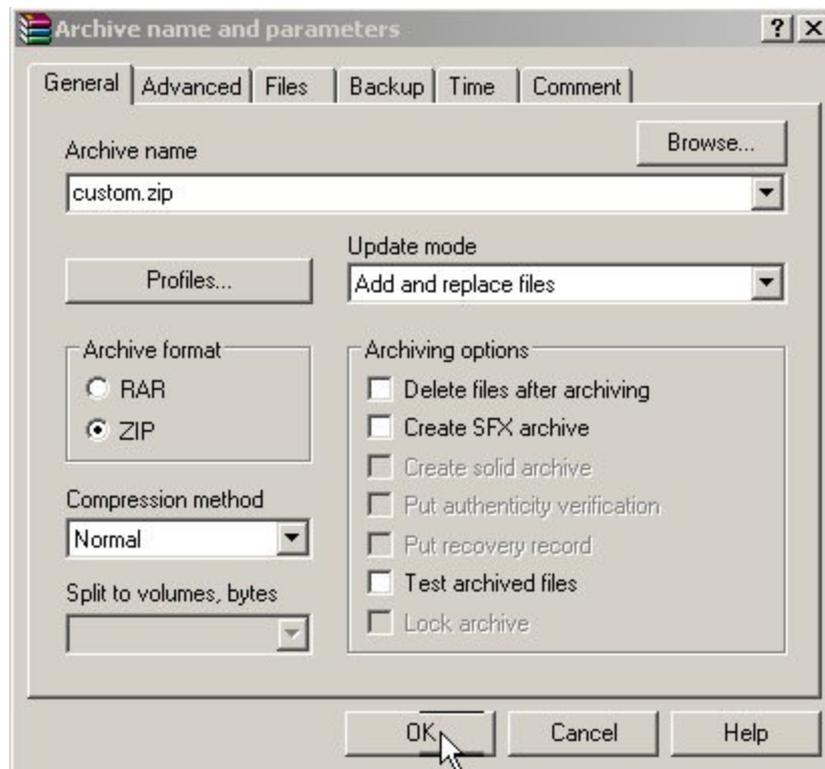

## Section 7:

# Repack the files into a ZIP file

1. we now need to repack all the files in the **CUSTOM** folder into a zip file. For my demonstration i will be using winrar as above in Section 1. To repack all the files into a single zip file select all the files by **highlighting** them all and right click with your mouse on a blue highlighted area and on the menu select **Add to archive**.

2. In winrar **change the file name** to a name you would like your EXE to be with the **.zip extension** at the end. When done click **OK** to create the archive.

3. **Congratulation's** you have successfully repacked the files into a zip archive.

## Section 8:

# Compiling your ZIP file to a EXE file On-line

1. Now we can compile our zip file to a exe file on line. To do this we need to open a web page on [Ultr@VNC](http://sc.uvnc.com). Click on the link below.

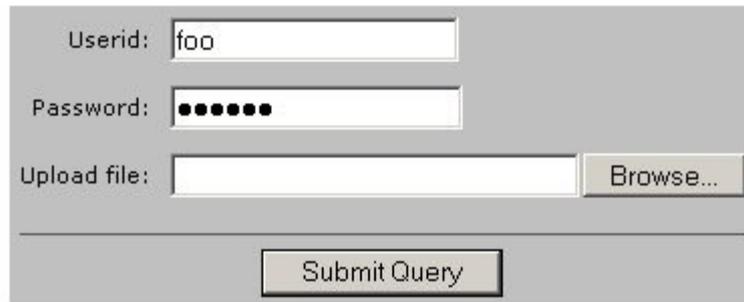

<http://sc.uvnc.com/index.php?section=19>

2. For this demonstration we will use the UltraVncSC based on RC23. In the following fields enter as below.

Under **Userid: foo**

Under **Password: foobar**

UltraVncSC based on RC23

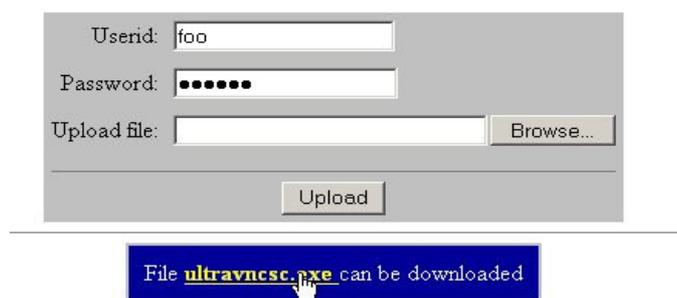

3. Next you will need to click on the Browse button and select the newly created **ZIP** file in the **CUSTOM** folder you have made.

4. When done selecting the zip file, click on the **Submit Query** button to continue.

5. After some time the web page will redirect and you will have the option to download the EXE file, click on the filename.exe at the bottom on the web page to download the exe file.

6. After you click in the EXE you will be prompted to save the file, Save the file to your desktop.

7. On your desktop you will now see your new Ultr@Vnc SC EXE, you may now upload it to your website.

8. **Congratulation's** you have successfully Created a Ultr@Vnc SC EXE.

You will need to do some testing on your new Ultr@Vnc SC EXE, note you cannot run the exe on your LAN if your helpdesk.txt is set to connect from out side your network to your network. Ask a friend on another site or client to test. Unless you change the helpdesk.txt to use your LAN IP ADDRESS and not your WAN.

You will need to download ULTR@VNC and install it on your Support people computers and run vncviewer.exe -listen on each computer as reflected in helpdesk.txt and the router.

You can download Ultr@Vnc from the link below.

<http://prdownloads.sourceforge.net/ultravnc/UltraVnc-101-Setup.zip?download>

You can also use the UltraVNC SC client Creator tool to create a Off line SC build  
<http://forum.ultravnc.net/viewtopic.php?t=4046>

Or do a Online Test with this tool.

<http://forum.ultravnc.net/viewtopic.php?t=4535>

Or if you don't want to make and EXE and want the client to enter the details use this tool.
